The concept of particles is particularly useful when modelling nature, as the full treatment of many phenomena can be complex and also involve difficult computation. It can be used to make simplifying assumptions concerning the processes involved. Francis Sears and Mark Zemansky, in University Physics, give the example of calculating the landing location and speed of a baseball thrown in the air.

Classical mechanics describes the motion of macroscopic objects, from projectiles to parts of machinery, and astronomical objects, such as spacecraft, planets, stars and galaxies.. If the present state of an object is known it is possible to predict by the laws of classical mechanics how it will move in the future (determinism) and how it has moved in the past (reversibility).

Ernest Rutherford merkte in 1898 op dat in een magnetisch veld ioniserende straling uit een bron van thorium of uranium uiteenviel in twee soorten: de alfastraling, zoals hij die noemde, werd enigszins de ene kant op gebogen, de bètastraling, ook zijn naam, veel sterker de andere kant op. . Rutherford mat de verhouding tussen de massa en de elektrische lading van het alfadeeltje en ...

$\vec{F}_m = Bi \vec{\ell}$ con $\vec{B} = \vec{F}_m / i \vec{\ell} =$ vettore induzione magnetica. In generale l'andamento della forza è dato da: (1) $\vec{F} = i \vec{B} \wedge \vec{\ell} = Bi \vec{\ell} \text{sen } \alpha$ La direzione di \vec{F} è sempre perpendicolare al piano formato da \vec{B} ed $\vec{\ell}$ ed il verso è

Il fotone, come ogni oggetto quantistico, possiede sia le proprietà di una particella sia quelle di un'onda. Tale caratteristica, detta dualismo onda-particella, è provata da fenomeni come la diffrazione e l'interferenza, verificati da molti esperimenti tra cui l'esperimento della doppia fenditura, in cui il passaggio di un singolo elettrone genera una figura di diffrazione.

Centro di massa e baricentro. Il centro di massa è comunemente detto baricentro. Questo nome (che etimologicamente significa centro del peso) deriva dal fatto che quando un corpo è immerso in un campo di gravità uniforme (come avviene, con buona approssimazione, sulla superficie terrestre, dove l'accelerazione di gravità si può ritenere costante), allora il moto del baricentro è ...

La masa inercial para la física clásica viene determinada por la segunda y tercera ley de Newton. Dados dos cuerpos, A y B, con masas inerciales m_A (conocida) y m_B (que se desea determinar), en la hipótesis dice que las masas deben ser constantes y que ambos cuerpos están aislados de otras influencias físicas, de forma que la única fuerza presente sobre A es la que ejerce B, denominada ...
